

Because items and quantities in the basket are fixed, the CPI does not account for substitutions consumers do in response to higher prices

CPI uses old quantity with new price

10
apples

\$0.30/each

10
apples

\$1/each

Cost of the

basket =

$$10 \times 0.3 = \$3$$

Cost of the
basket =

$$10 \times 1 = \$10$$

We do not calculate the CPI correctly: Substitution Bias

The CPI
reports **233%**
inflation

We **do not** calculate the CPI correctly: **Substitution** Bias

Because items and quantities in the basket are **fixed**, the CPI **does not account for substitutions** consumers do in response to higher prices

CPI uses **old** quantity with **new price**

Cost of the
basket =
 $10 \times 0.3 = \$3$

The CPI
reports **233%**
inflation

Cost of the
basket =
 $10 \times 1 = \$10$

\$1/each

To avoid a drop in **real** salary, the **nominal** salary **must**
increase by inflation
