Same distance from B

A diagram consisting of two arrows originating from a common point. One arrow is red and points towards the upper-left, while the other is blue and points towards the lower-right. The two arrows are of equal length and are positioned symmetrically relative to a vertical line passing through their common origin, illustrating that they represent the same distance from a central point.

To calculate the Elasticity at point B

$$e_p^d = \frac{\% \text{ change in quantity demanded}}{\% \text{ change in Price}}$$
