

GDP alone is not a perfect measure of wellbeing

 Income must be **equally distributed** to serve as a measure of wellbeing

◆ GDP **includes production of "bads"** (addictive drugs, vaping products, etc) which represent loss of welfare

❖ GDP **does not include non-market production** which contributes to wellbeing

Because for some countries production is mostly non-market, their GDP can not be used for cross country comparisons

- GDP is best used for comparisons among countries in similar stage of development or for self comparisons.

# GDP alone is not a perfect measure of wellbeing
