

 $M^{d} = 300b$

 $l_1 = 3\% - - -$

M is the amount of currency + deposits the public actually holds = 900b

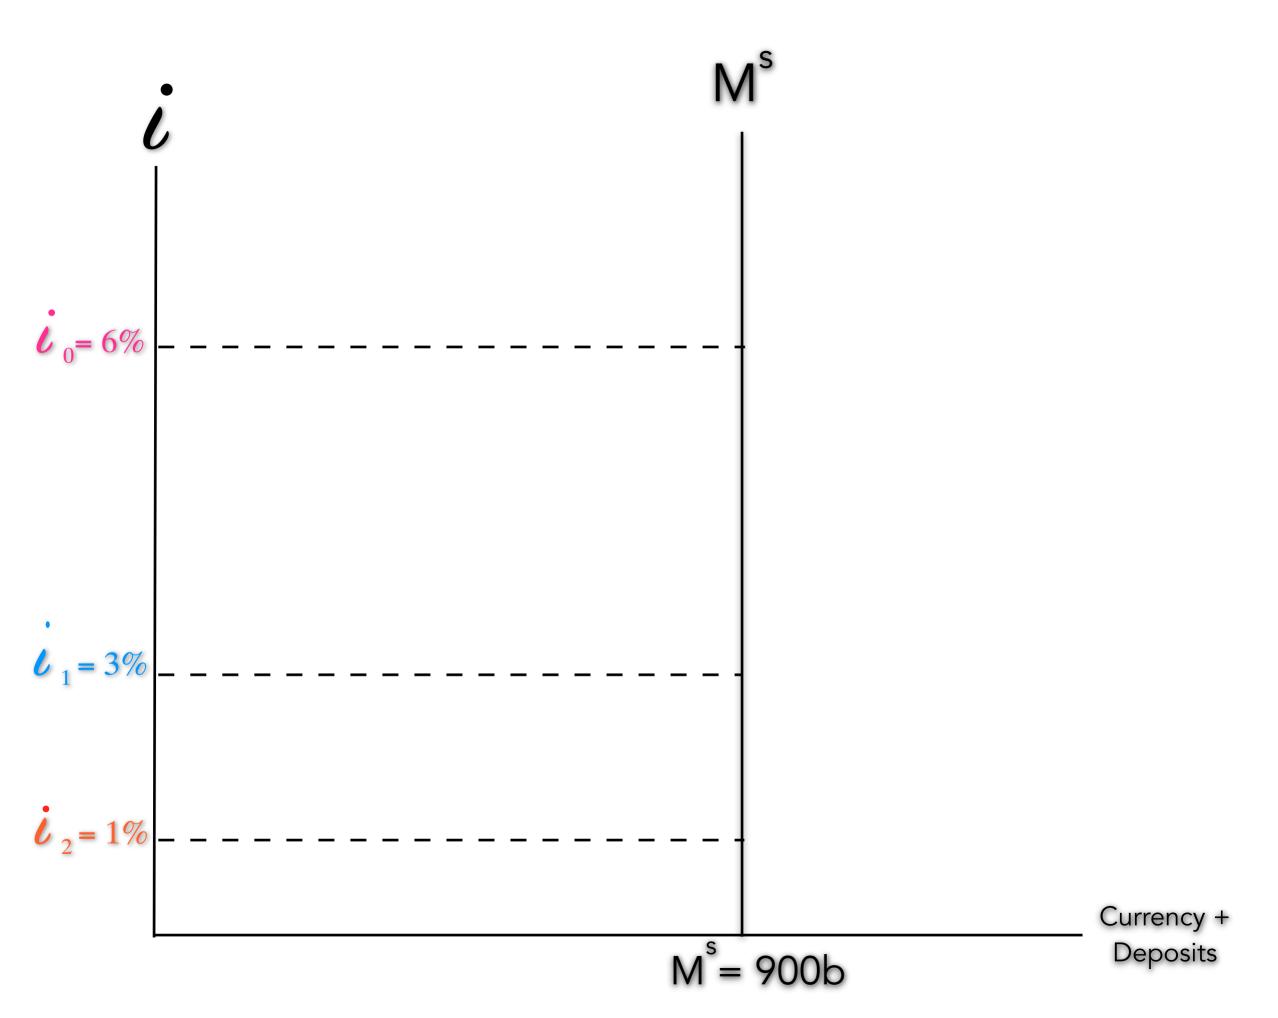

If the interest rate is 3%, the amount of currency + deposits the public needs to hold for transactions is 900b

An example

If the interest rate is 6%, the amount of currency + deposits the public needs to hold for transactions is 300b

If the interest rate is 1%, the amount of currency + deposits the public needs to hold for transactions is 1,200b

The Money Supply

The Money Demand

If the interest rate is 3% the public has exactly as much liquid balances as they need for everyday transactions

(If the interest rate is 6% the public is holding (in cash and deposits) more liquid balances than they need for everyday transactions

The public has excess liquid balances which they do not need for transactions, sitting idle (not earning interest) in cash and checking accounts

The public does not have enough liquid balances (cash and deposits) to pay for transactions
